

Introduction to Starches & Their Functional Properties

Prof. Jagadish S Pai
Exec. Director, PFNDAI
Former HOD & Professor, Food Tech, UDCT (ICT Mumbai)

Starches in Our Foods

- Indians, both vegetarians and non-vegetarians consume diet containing large amount of plant foods
- Our diet consists of grains like wheat & rice, pulse like peas, chana & beans and root vegetables such as potatoes
- All these have plenty of starches

Starch Contents of Some Foods

- Grains

White rice 78%, Wheat 60%, Barley 58%
Rice flour 79%, Wheat Flour 72%, Corn Meal 65%

- Pulses

Peas: 45-50%, Lentils 44-50%, Chickpeas 44%

- Tubers

Potato 17%, Sweet Potato 17%, Yam 20%

- Food Products

Bread 66%, Noodles 65%, Naan 43%,
Paratha 32%, French fries 24%,

CEREALS

PASTA
(macaroni, spaghetti, noodles,...)

RICE

CORN

BREAD

What are Starches?

- Starches are Carbohydrates and are present in foods along with sugars and dietary fibres
- Starches are polymers of glucose, so when digested they form into glucose with the help of enzymes, amylases
- Different foods have different amounts and types of starch
- Chemically there are two types of starch molecules: amylose and amylopectin
- Digestibility-wise three types: Rapidly Digestible Starch (RDS), Slowly Digestible Starch (SDS) & Resistant Starch (RS)
- Amylose gets digested and absorbed slowly. Thus starchy foods with higher amylose have lower glycemic index (GI) and provide sustained energy.
- About 70-80% of natural starch is amylopectin that digests rapidly (RDS). This tends to make high GI foods. They provide energy quickly especially in athletic performance and recovery.
- There is also Resistant Starch (RS) which is not digested by our enzymes but could be used by colon bacteria. So they act like dietary fibre. Some foods like whole grains, potatoes & green bananas have good amounts of RS

Benefits of Starches

- Although Rapidly Digested starch may increase GI and may not be suitable in large amounts to diabetics or for weight reduction, RDS are very useful for athletes who need quick energy and also for recovery after a very vigorous workout
- Infants and patients recovering may need easily digested energy providing nutrients and RDS starch is the best
- Slow digesting (SDS) starch is better for sustained energy for long distance runners and also for weight loss.
- Both SDS and Resistant (RS) starch give low GI to food and are good for diabetics.
- RS also works as prebiotic and helps probiotics grow; it improves insulin sensitivity; it lowers LDL and helps HDL cholesterol levels

GLYCEMIC INDEX CHART
 Low Glycemic (55 or Below) High Glycemic (70 or Higher)

SNACKS	G.I.	STARCH	G.I.	VEGETABLES	G.I.	FRUITS	G.I.	DAIRY	G.I.
Pizza	33	Bagel, Plain	33	Broccoli	10	Cherries	22	Yogurt, Plain	14
Chocolate Bar	40	White Rice	38	Pepper	10	Apple	38	Yogurt, Low Fat	14
Pound Cake	54	White Spaghetti	38	Lettuce	10	Orange	43	Whole Milk	30
Popcorn	55	Sweet Potato	44	Mushrooms	10	Grapes	46	Soy Milk	31
Energy Bar	58	White Bread	49	Onions	10	Kiwi	52	Skim Milk	32
Soda	72	Brown Rice	55	Green Peas	48	Banana	56	Chocolate Milk	35
Brownnut	76	Pancakes	67	Carrots	49	Pineapple	56	Yogurt, Fruit	36
Jelly Beans	80	Wheat Bread	80	Beets	64	Watermelon	72	Custard	43
Pretzels	83	Baked Potato	85	Onions	75	Dates	103	Ice Cream	60

Glycemic Index values obtained from www.longlycemicindex.com, www.nutritiondata.com and www.diabetesnet.com

What are Starches

- Starch is a polymer of glucose chains
- Straight chain as in amylose
- Branched chain in amylopectin
- Any starch contains both in different proportion
- Amylose & amylopectin have different properties so their combinations in different starches give them different properties

Chemical Structure of Starches

- Structure of Amylose

- Structure of Amylopectin

- Structure of Starches

- Resistant Starch

Amylose

Amylopectin

Amylose Content of Various Starches

Starch Source	% Amylose
Waxy Rice	0
High Amylose Corn	70
Corn	28
Cassava	17
Waxy Sorghum	0
Wheat	26
Sweet Potato	18
Arrowroot	21
Sago	26
Potato	20

Resistant Starches

Types of RS

Examples of occurrence

RS₁: Physically inaccessible Whole or partly-milled grains and seeds

RS₂: Resistant granules

Raw potato, green banana, some legumes and high-amylose starches

RS₃: Retrograded

Cooked and cooled potato, bread and cornflakes

RS₄: Chemically modified

Etherised, esterified or cross-bonded starches (used in processed foods)

SOURCES OF RESISTANT STARCH

(PER 100 GRAMS OR 1/2 CUP)

BEANS
2-4g

BROWN RICE
3.5g

GREEN BANANAS
4.7g

LENTILS
3.4g

MUESLI CEREAL
3.2g

OATS
3.6g

POTATOES
3.6g

Properties of Starches

Functional Properties of Starches in Foods

- specific viscosity (hot and cold)
- thin boiling (faster canning heat transfer)
- viscosity resistance acid/mechanical shear
- freeze-thaw stability (natural / modified)
- gel texture, body at various temperatures
- clarity, opacity
- processing conditions tolerance
- oil retention, high or low
- resistance to setback. (gel formation)
- high sheen
- flow properties
- emulsion stabilizing capacity
- mouthfeel, lubricity, palate-coating
- suspension characteristics
- adhesiveness
- crystallinity
- bland taste
- long shelf-life stability
- hygroscopicity
- colour
- anti-caking
- cold-water swelling or dispersibility
- swelling and resistance to swelling
- film-forming properties

Properties of Native Starches

- Amylose is very difficult to solubilise and tends to retrograde
- Amylopectin is easier to solubilise and holds its hydrated and gelatinised structure better
- Properties of starch is combination of two fractions
- Most starches contain amylopectin 70 to 80% or more
- Some corn & barley varieties have more amylose

Why Modified Starches

- Starch in water is a colloidal solution
- Industrial applications depend on physico-chemical properties & functionality
- Native starch has limited functionality & applications
- Wide range of modification for different purposes
- Starch can be modified by hydrolysis, esterification, etherification & oxidation
- These modifications make starch suitable for baked foods, confectioneries, soups and salad dressings etc.
- Gelatinization, Enzymic Hydrolysis or Chemical Modification

Chemical Modification

- Esterification
- Ethrification
- Oxidation
- Cross-linking

Modified starches including physical, enzymic and chemical modified starches have properties for thickening, gelling, emulsification etc far superior than native starches. They have been used in canned foods, baked goods, frozen foods, salad dressings, baby foods, beverages etc.
